

## Membrane Dryers KMM Series

Flow volume at inlet up to 4.40 m<sup>3</sup>/min

#### Why is it necessary to dry compressed air?

The atmospheric air drawn into a compressor is a mixture of gases that always contains water vapour. The amount of water vapour air can carry varies and is mostly dependent on temperature. When air temperature rises – as happens during compression – the air's ability to hold moisture increases also. When the air is cooled, its capacity to hold moisture reduces, which causes the water vapour to condense. This condensate is then removed in the centrifugal separator, or the air receiver, downstream from the compressor. Even then, the air can still be completely saturated with water vapour. This is why, as the air cools further, significant amounts of condensate can accumulate in the air distribution piping and at takeoff points. Therefore, additional drying is essential to avoid production downtime and interruptions, as well as reduce costly maintenance and repair work.

#### How the membrane dryer module works

Moist compressed air flows into the module casing where it comes into contact with the membrane fibres. A minimal amount of this now dry compressed air is used as purge air and is drawn upwards around the fibres and expands to atmospheric pressure. The resulting increase in volume increases the air's water retention capacity. In combination with with the selectivity of the membrane, the differing water content of the purge air flow and the flow of air to be dried (both flowing in opposite directions), allows water molecules – almost exclusively – to diffuse through the fibre wall. There are separate outlets for the dried compressed air and the purge air.

# **Decentralised Compressed Air Drying**

**LAESER** 

# KMM – Efficient, reliable, maintenance-free

The KAESER Membrane Module (KMM) not only features the unique "Flow" concept which is designed for long-term efficient air drying and maximum service life, but also uses new highly effective hollow fibre membranes that are woven in a densely packed "helix" structure. Requiring minimal space and no additional power source, the KMM achieves pressure dew points from +3 to -40 °C.

KAESER KOMPRESSOREN – The compressed air systems provider: From the compressor right through to the air treatment equipment, all components in a Kaeser compressed air system are designed to work perfectly with one another to ensure unrivalled reliability and efficiency.

#### **Exceptional dependability**

KAESER

The new KMM dryer design provides many advantages over conventional membrane dryer models, as the "Flow" concept ensures outstanding drying results through highly effective moisture removal, enhanced pressure stability and reduced differential pressure. Furthermore, in combination with KAESER compressed air filters, the design also provides protection from any contamination that may enter the dryer, as it is trapped before it can reach the sensitive membrane fibres.

#### High performance "Flow" concept

The "Flow" concept of inside to outside permeation enables the highly resistant membrane fibres in the dryer insert to ensure exceptional drying results.

# Heltshopen intes

#### **Efficient "Helix" Structure**

The internally coated membrane fibres are wound in a "helix" structure that increases the fibre surface area in contact with the compressed air. This results in even air distribution and increased efficiency in a reliable, compact drying unit.

#### **Precision Purge Air Nozzle**

Precision purge air delivery via a specifically dimensioned nozzle significantly reduces operating costs, as only the required volume of compressed air for purge use is diverted.

#### **Energy-Saving Purge Air** Stop Valve (Option)

To avoid unnecessary flow of purge air, the solenoid stop valve on the purge air outlet can be set to close during times when there is no compressed air demand.

# **KMM —** Eight Decisive Advantages

#### "Flow" Concept

Each hollow membrane fibre consists of a highly porous support layer and an internal separating membrane layer that is permeable only by water. Due to the differential pressure between the purge air and the damp compressed air, the moisture contained in the compressed air evaporates as it enters the fibres and permeates the separating membrane layer. This means that the pores in the support layer are always able to let water vapour through, even if moisture condenses on the module or fibres.

#### 2 **Outstanding Performance**

The spiralled helix structure of the fibres in the inner chamber of the dryer module means that the module is now shorter, yet has the same drying capacity as previous longer models. At the same time it presents the maximum membrane surface area to the moist air and ensures an even flow of air through the fibre module. This feature, combined with the "Flow" concept, results in outstanding drying performance from a compact and highly efficient package.

#### **Maximum Reliability** 3

All functional components of the KMM dryer are integrated within a highresilience enclosure. KAESER microfilters installed upstream from the unit protect it from potential damage from dust, aerosol and oil contamination, whilst the KMM design ensures continuous compressed air drying. The actual composition (ratio of primary components, i.e. nitrogen and oxygen) of the air remains unchanged.

#### **Energy-Saving Purge Air Stop Valve (Option)**

To avoid unnecessary flow of purge air, the solenoid stop valve on the purge air outlet can be set to close during times when there is no compressed air demand. Furthermore, the valve provides unrivalled reliability and operated perfectly for well in excess of 1 million switching sequences under rigorous testing conditions.

#### **6** Super-fine Membrane Fibres

Compared with conventional membrane fibres, the fibres in Kaeser Membrane Modules (KMM) are much finer and far more densely packed. Consequently, the surface area available for compressed air drying is significantly larger and achieves superior drying results. The fibres are also mechanically stable, which means that they provide exceptional performance and long service life.

The KMM dryer can be quickly and easily mounted on the wall (preferable) using optionally available mountings. Furthermore, a specially designed installation and connection set allows the KMM to be installed in combination with various compressed air filters (e.g. FG activated carbon filter).

#### 4 No Additional Power Necessary

The KMM membrane dryer features a rugged housing, requires no external power source, has no moving parts and releases the moisture removed from the compressed air as harmless water vapour into the ambient surroundings. With only the pre- and after-filters requiring intermittent replacement, the dryer uses no additional consumable items.

#### **8** Condensate Drainage Without Pressure Loss (Option)

For outstandingly safe and reliable condensate drainage, the upstream micro-filter can be equipped with an electronic ECO Drain system. The pre-filtration stage can also be monitored using a filter monitor (E-Pack version) and an optional electronic filter monitor box.

# **Versions and Options**

#### KMM with FE/FF filter - Standard version

- KMM membrane dryer using the "Flow" concept and helically wound fibres
- Pre-filter equipped with a float-controlled condensate drain and pressure differential indicator
- Filter to be fitted by the user, connection components included
- Outlet silencer also included

#### KMM without pre-filter

- For customer-specific filter combinations
- Filter must be installed at customer's premises
- Outlet silencer also included

#### KMM with FE/FF filter, filter monitor and ECO Drain condensate drain

- Electronic monitoring of microfilter
  - Microprocessor-controlled liquid crystal display
- Monitors operating time, pressure differential and most economical operating mode
- Maintenance indicator: Filter change
- Sends alarm signals via the additional monitor box to master compressed air management systems

#### ECO-Drain condensate drain

- High performance level sensor
- -Intelligent control system
- -Self-monitoring
- -Condensate drainage without pressure loss

#### **Membrane dryer applications**

- · Limited space and/or mobile operation (container, vehicle)
- Seasonal operation at sub-zero temperatures downstream of a refrigeration dryer for pressure dew points below +3 °C (workshops, petrol stations)
- Drying of relatively small air volumes directly at air-consuming equipment, e.g. CNC machines

#### Different fields of application require different grades of air treatment
